FiXs Credential Issuer

FiXs credentials promote Interoperability, Performance, Trust, Privacy, and Protection

Federation for Identity & Cross-Credentialing Systems (FiXs) provides a trusted mechanism for federated identity infrastructure within and between public and private sector organizations. A key component to the network integrity is its strong credential authentication and revocation processes, as governed by the FiXs operating rules. Through the application of a sophisticated Federated Trust Model, disparate organizations can interoperate and authenticate identities, while managing privileges locally. The network capabilities can be accessed worldwide, in remote or fixed environments, wired or wirelessly, and in real-time.

DSA is a certified Personal Identity Verification (PIV) Issuer of FiXs Credentials. FiXs credentials feature the following:

- Both physical and logical identity authentication
- FIPS 201, PIV-1 and HSPD-12 compliance as required under the Federal Information Security Management Act (FISMA)
- Compliance with PIV Interoperability for Non-Federal Issuers requirements
- DoD-approved ECA certificates with the same assurance level as the DoD Common Access Card (CAC)
- Proven compatibility with DoD trusted sites
- Complies with FAR contract requirements
